

# Pim *Protocol*

*A Layer-1 blockchain that runs full node sovereignty on a \$3 chip, prices its native currency to hold steady instead of swing, and secures itself with quantum-resistant cryptography from day one — built for the two billion people existing crypto infrastructure was never designed to reach.*

01

## \$3-Hardware Sovereignty

Full coin verification on 256KB-RAM devices, no TPM required — the Sovereign Edge Layer.

02

## Graduated Monetary Policy

A four-state circuit breaker (ADTMS) replaces a binary halt with proportionate, observable response.

03

## Post-Quantum From Genesis

Full NIST FIPS 203/204/205 + HQC suite deployed at launch — nine years ahead of the 2035 deadline.

04

## 100,000 TPS Theoretical

100 dynamic, AI-rebalanced shards with ~8s cross-shard finality.

05

## Enforcement Funds Stability

Slashed governance tokens route to the stability reserve — never burned, never wasted.

### TOKEN HEADLINE

TICKER — GOVERNANCE

**PYM**

TICKER — PAYMENTS

**QOL**

PYM TOTAL SUPPLY

**100,000,000 (hard cap, genesis)**

QOL TOTAL SUPPLY

**Demand-responsive — no fixed cap**

UNLOCKS / VESTING

*Spec gap — not specified in Whitepaper*

MAINNET

*Spec gap — testnet target Q3 2026 only*

Not investment advice. Not an offer to sell or a solicitation to buy any security. Pim Protocol has not reached mainnet launch; figures are design targets. QOL and PYM are utility and governance instruments, not investment contracts.
